The Sonography Educator's Toolkit for Developing Critical Thinkers

Nicole Y. García Santiago MHS, RDMS, RVT, RDCS

1

SPEAKER PRESENTATION DISCLAIMER

The content and views presented are made available for educational purposes only. The information presented are the opinions of the presenter and do not necessarily represent the views of the Society of Diagnostic Medical Sonography (SDMS) or its affiliated organizations, officers, Boards of Directors, or staff members.

The presenter is responsible for ensuring balance, independence, objectivity, scientific rigor, and avoiding commercial bias in their presentation. Before making the presentation, the presenter is required to disclose to the audience any relevant financial interests or relationships with manufacturers or providers of medical products, services, technologies, and programs.

The SDMS and its affiliated organizations, officers, Board of Directors, and staff members disclaim any and all liability for all claims that may arise out of the use of this educational activity.

2

GENERATIVE AI DISCLAIMER

The presenter utilized the use of large language models (LLMs) and generative artificial intelligence (AI) as a productivity tool to assist in drafting and refining content in this presentation.

While these tools can aid in structuring ideas, summarizing, paraphrasing, and language polishing, they have inherent limitations and cannot replace human creativity, critical thinking, or expert judgment. AI-generated content may contain errors, biases, or gaps in knowledge.

This presentation is intended for informational purposes only and should not be construed as definitive or authoritative guidance. Participants are encouraged to critically evaluate the information presented and consult relevant experts as needed. The SDMS and its affiliated organizations, officers, Board of Directors, and staff members disclaim any and all liability for claims that may arise from the use or interpretation of this educational material.

3

Objectives

- Identify active learning strategies used in sonography education to support critical thinking development.
- Describe teaching approaches that facilitate student analysis of clinical findings during scanning.
- Outline methods for incorporating professional development strategies into sonography curricula.

4

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Critical thinking in sonography is essential for transforming image acquisition into meaningful clinical insight.

Understanding what critical thinking entails, why it profoundly impacts patient care, and recognizing common obstacles are foundational steps for educators aiming to cultivate advanced reasoning skills in sonography students.

5

Defining Critical Thinking in Sonography

General Definition

- Disciplined, active process involving analysis, synthesis, and evaluation of information.
- Questions assumptions and explores alternative interpretations.
- Applies knowledge purposefully to reach well-reasoned conclusions.
- Engages reflective thinking beyond surface-level facts.

6

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Defining Critical Thinking in Sonography

In Sonography Specifically

- Integrates real-time ultrasound images with patient history and clinical context.
- Moves beyond capturing protocol images to meaningful clinical interpretation.
- Synthesizes anatomical knowledge with dynamic findings to support diagnosis.
- Applies sonographic reasoning to guide real-time clinical decision making during scanning and assessment.

7

Anatomy Recognition vs. Clinical Correlation

Anatomy Recognition

Clinical Correlation

Image Interpretation

8

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Why Critical Thinking Matters?

Patient Safety

Missed findings or misidentified anatomy can lead to serious patient harm. Sonographers are often the first to detect abnormalities, making vigilance and critical thinking essential to safe, effective care.

Operator-Dependent Modality

Unlike CT or MRI, ultrasound image quality and diagnostic content depend heavily on the sonographer's real-time scanning decisions, requiring continuous critical analysis during image acquisition.

9

Why Critical Thinking Matters?

Expanding Scope of Practice

Sonographers are increasingly assuming advanced clinical roles that require higher-level reasoning skills, making critical thinking a foundational skill for professional growth and expanded responsibilities.

Professional Accountability

Credentialed sonographers bear responsibility for the accuracy, completeness, and clinical relevance of diagnostic studies, requiring sound judgment and ethical decision-making at every step.

10

Why Critical Thinking Matters?

Patient Safety

Operator-Dependent Modality

Expanding Scope of Practice

Professional Accountability

11

Bloom's Taxonomy Applied to Sonography Education

Bloom's Taxonomy Level	Sonography Education Task Example
Remember	Recall anatomical names and ultrasound terminology
Understand	Explain the function of organs seen in ultrasound images
Apply	Perform basic ultrasound scanning to identify anatomical structures
Analyze	Differentiate between normal and abnormal sonographic images
Evaluate	Assess image quality and adjust scanning technique accordingly
Create	Design a scanning protocol for complex patient cases

12

Characteristics of a Critical-Thinking Sonographer

Curiosity

Systematic Reasoning

Intellectual Humility

Pattern Recognition

Adaptability

Clinical Contextuality

13

Common Barriers to Critical Thinking in Sonography Students

Student-Side Barriers

- Passive learning habits carried over from prior education experiences
- Reliance on protocol checklists without engaging underlying reasoning
- Rote memorization driven by test anxiety rather than understanding
- Limited exposure to clinical scenarios early in training
- Difficulty coping with ambiguity and clinical uncertainty

14

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Common Barriers to Critical Thinking in Sonography Students

Educator and Program Barriers

- Curricula focused heavily on procedural skills over critical analysis
- Insufficient time allocated for discussion, reflection, and reasoning
- Assessment methods prioritize recall instead of reasoning skills
- Feedback often lacks specificity to guide reasoning improvement
- Scan labs emphasize throughput, limiting teachable reflective moments

15

Think of a recent student struggle. Which Bloom's level were they stuck at and what would it take to move them one level higher?

16

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Active learning transforms sonography students from passive listeners into confident clinical reasoners before they ever pick up a probe.

Critical thinking develops through active engagement, reflection, and application, not through passive receipt of information alone.

17

Why Active Learning?

The Passive Classroom Problem

Active Learning Defined

18

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Active Learning in the Didactic Setting

Active Learning Strategy	Primary Critical Thinking Skill Targeted
Think-Pair-Share	Analysis and Interpretation
Case-Based Learning	Application and Clinical Reasoning
Flipped Classroom	Synthesis and Independent Learning
Concept Mapping	Organization and Integration
Image-Interpretation Drills	Analytical Observation

19

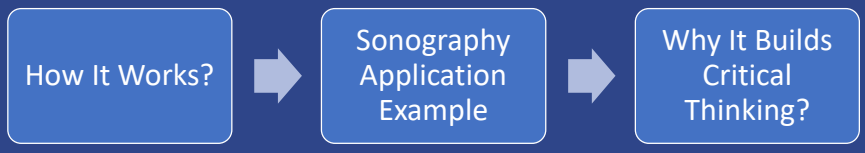
Active Learning in the Didactic Setting

Active Learning Strategy	Primary Critical Thinking Skill Targeted
Socratic Questioning	Evaluation and Reflection
Peer Teaching	Communication and Explanation
Gamification & Audience Response Systems	Motivation and Engagement
Worked Examples and Error Analysis	Problem Solving and Error Recognition

20

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Think-Pair-Share in Sonography Didactics



21

Case-Based Learning

- What It Is?
- Case Structure
- Example Case Prompt
- Educator Role
- Scaling Complexity

22

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

The Flipped Classroom

01 Before Class (Asynchronous)

Students study pre-recorded lectures, annotated images, or readings on core content like biliary anatomy at their own pace before class.

02 In-Class Time (Synchronous)

Class focuses on application: case discussions, image analysis, group problem-solving, and Q&A to practice clinical reasoning actively.

03 Educator Design Considerations

Pre-class content must be clear and accessible. Use quizzes or reflection prompts to ensure preparation. Align activities with pre-class work.

23

Image Interpretation Drills

- **Rapid Recognition Rounds**
- **What Is Wrong With This Image?**
- **Differential Generation Exercises**
- **Progression Principle**

24

Socratic Questioning: The Educator's Most Powerful Tool

Socratic Question Types in Sonography

- Clarification: 'What exactly do you mean by that finding?'
- Probing Assumptions: 'What are you assuming about this patient's history?'
- Probing Evidence: 'What on this image supports that conclusion?'
- Exploring Alternatives: 'What else could explain that appearance?'
- Probing Implications: 'If that is a true finding, what would you expect to see elsewhere?'

25

Socratic Questioning: The Educator's Most Powerful Tool

Implementation Tips

- Use during case discussions, image reviews, and scan lab debriefs
- Avoid rapid-fire questioning to reduce student anxiety; allow thoughtful wait time
- Model intellectual humility: 'That is a reasonable interpretation — let me push you further'
- Encourage students to explain their thinking aloud to reveal reasoning paths
- Frame questions to guide rather than judge, fostering a safe learning environment

26

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Peer Teaching and Near-Peer Learning

Students who teach peers must organize, consolidate, and articulate knowledge at a deeper level, which uncovers gaps in understanding and strengthens mastery—a powerful educational psychology principle.

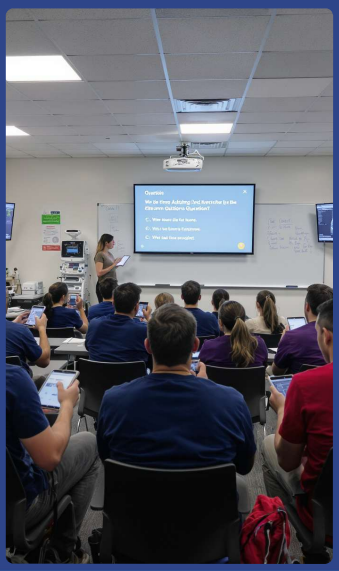
Peer teaching requires careful scaffolding and instructor monitoring. Educators correct misconceptions during sessions and explicitly debrief key learning points to reinforce accurate reasoning.

27

Gamification and Audience Response Systems

What and Why

- Gamification incorporates game elements like points and competition to motivate learners.
- Immediate feedback helps learners adjust understanding in real time.
- Audience Response Systems such as Kahoot and Poll Everywhere enable anonymous, instant polling during class.



AI-generated visual created by presenter for educational purposes

28

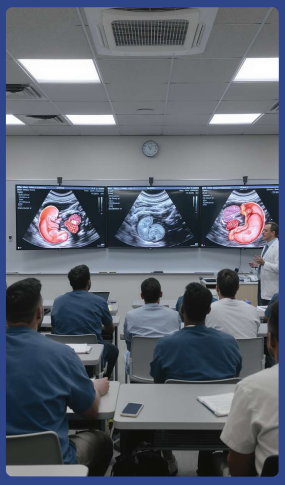
Gamification and Audience Response Systems

Critical Thinking Applications

- "Diagnosis Derby": competitive rounds identifying sonographic images under time pressure.
- Scenario-based quizzes escalate in cognitive challenge to deepen analysis.
- Leaderboards reward quality of reasoning, not just speed, fostering thoughtful participation.



AI-generated visual created by presenter for educational purposes

29

Worked Examples and Error Analysis

Worked Examples

Error Analysis Exercises

Why Error Analysis Builds Critical Thinking

Layering Strategies: Building a Critical-Thinking Lesson

01 Prime (Pre-Class)

02 Activate (Class Opening)

03 Explore (Core Instruction)

04 Apply (Active Practice)

05 Consolidate (Close)

31

The scan lab is where cognitive frameworks meet real-time clinical reasoning at the transducer.

This environment transforms procedural scanning into an active reasoning process. Students apply didactic knowledge through structured, reflective exercises that promote decision-making, problem-solving, and adaptive thinking during live scanning sessions.

32

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

The Scan Lab as a Critical Thinking Environment

What the Scan Lab Must Be

- More than procedural repetition — a structured cognitive training space.
- Encourages students to question: 'Why is this image like this?' and 'What if findings differ?'
- Every scanning session is an opportunity to connect technique with clinical meaning.
- Promotes active verbalization of reasoning during scanning, not just image acquisition.
- Fosters an environment where students move beyond checklist completion to thoughtful analysis.

33

The Scan Lab as a Critical Thinking Environment

The Educator's Role Shifts

- From image validator ('Did you get the image?') to reasoning coach.
- Focuses on students' thought processes behind scanning adjustments.
- Encourages and models verbalizing clinical reasoning in real time.
- Intervenes to correct reasoning errors as they occur during scanning.
- Creates a safe space for students to express uncertainty and explore hypotheses aloud.

AI-generated visual created by presenter for educational purposes

34

Simulation and Phantoms

Role of Simulation

- Allows practice in a low-stakes environment without patient risk
- Enables repetition of rare or complex clinical scenarios
- Facilitates skill refinement before real patient contact
- Most effective when paired with structured debriefing sessions
- The scan itself triggers reflection and learning rather than passive observation
- Simulation provides deliberate exposure to uncommon pathology that students may not encounter during limited clinical rotations, allowing educators to intentionally develop clinical reasoning skills.

35

Simulation and Phantoms

Types of Simulation Tools

- Tissue-mimicking phantoms for image optimization and guided procedure drills
- Standardized patient encounters integrated with ultrasound for clinical reasoning
- Simulation complements but does not replace real patient scanning experience
- Supports bridging theory to practice in a controlled setting

36

Image Optimization Reasoning
The 'Why Behind the Knob'

AI-generated visual created by presenter for educational purposes

The Problem With Knob-Turning by Feel

Teaching Optimization Reasoning

Structured Optimization Exercise

37

Scan and Explain

What It Is

A structured scan lab exercise where students narrate their observations, actions, and rationale aloud during scanning, promoting active clinical reasoning in real time.

Educator Benefit

Makes the student's thought process visible, enabling the instructor to identify and correct reasoning errors instantly during the scan session.

38

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Scan and Explain

Student Benefit

Develops metacognitive awareness by requiring students to continuously monitor and articulate their understanding, bridging implicit skills with explicit knowledge.

Scaffolding the Exercise

Begin with guided prompts encouraging narration, gradually moving toward spontaneous, continuous verbalization until it becomes a natural part of scanning evaluations.

39

Troubleshooting Artifacts: A Masterclass in Reasoning

Why Artifacts Are a Critical Thinking Goldmine

- Artifacts challenge students to differentiate real anatomy from acoustic phenomena.

Artifact Reasoning Exercise Structure

- Present an ultrasound image containing a suspected artifact.
- Ask: 'Is this finding real or artifactual? How can you tell?'

40

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Facilitating Student Analysis During Live Scanning

- Live scanning presents unique challenges: dynamic patient anatomy, unexpected findings, and time constraints increase cognitive load and demand adaptive reasoning.
- Effective clinical instruction uses a structured questioning framework: 'What do you see? What does it mean? What next? What is the take away?' To guide student analysis and decision-making.
- Time management strategies, such as brief pre-scan huddles and post-scan debriefs, protect thinking time and encourage deliberate practice in a fast-paced clinical setting.

41

Structured Clinical Reflection

- Why Reflection Matters (Schön, 1983)
- The Structured Debrief (Post-Scan)
- Tools for Reflection

45

Clinical Case Scenario 1: Abdominal Pain & Elevated LFTs

Case Overview

- 58-year-old female referred for abdominal ultrasound
- Indication: Right upper quadrant pain, fever, elevated alkaline phosphatase and bilirubin
- Prior history: hypertension, no prior abdominal surgeries
- Clinical concern: possible biliary obstruction or cholecystitis

Student Challenge

Educator Guidance

46

Clinical Case Scenario 2: Incidental Finding During OB

Case Overview

- 28-year-old female at routine 20-week fetal anatomy survey.
- Student completes a normal fetal survey with standard measurements.
- Student identifies a complex adnexal mass near the uterus, not on requisition.
- Incidental finding causes uncertainty about documentation and workflow.

Educator Debrief Points

47

Assessment of Critical Thinking

Measuring reasoning, not just recognition: expanding assessment tools beyond the checklist

- Traditional checklists confirm task completion but miss how students think about unexpected findings or adapt to complexity.
- Image-based exams assess integration of images with patient history and clinical decision-making.
- Assessors must learn to recognize reasoning, not just technical skill, to foster a culture valuing clinical judgment.

48

© Copyright. Society of Diagnostic Medical Sonography. All Rights Reserved.

Why Traditional Checklists Fall Short

What Checklists Measure

- Task completion
- Adherence to scanning protocols and sequence to ensure consistency.
- Focus on observable actions
- Necessary foundation for competency but insufficient to assess decision-making or adaptability.

49

Why Traditional Checklists Fall Short

What Checklists Miss

- Quality of clinical reasoning
- Adaptability to variant anatomy or unexpected pathology during scanning.
- Integration of patient history
- Communication skills and professional judgment in reporting and escalating findings.
- Difference between a student who mechanically completes the protocol and one who comprehends and thinks critically.

Image-Based Exams & Unknown-Case Interpretation

The Rationale

- Sonographers frequently encounter unexpected or incidental findings during clinical scans, making unknown-case interpretation essential for real-world readiness.
- Image-based exams push beyond simple identification to require interpretation of sonographic studies in context, promoting deeper clinical reasoning.
- This method assesses key cognitive skills: visual pattern recognition, differential diagnosis, and clinical synthesis of findings.

53

Image-Based Exams & Unknown-Case Interpretation

Design Principles

- Present a brief clinical case that includes patient history and scan indication alongside ultrasound images or cine clips.
- Ask students to describe what they observe in the images before interpreting findings, fostering objective observation skills.
- Instruct students to recommend next steps, such as additional imaging or clinical actions, to encourage synthesis and decision-making.
- Use structured response formats to make reasoning processes transparent and assessable for educators.

54

Giving Effective, Growth-Oriented Feedback

Feedback Principles (Hattie & Timperley, 2007)

Feedback on Reasoning, Not Just Technique

The SBI Model (Situation – Behavior – Impact)

Creating a Feedback Culture

55

Design a Critical-Thinking Assessment

- Form groups of 2–4 participants for a 5-minute design session.
- Choose a clinical scenario relevant to your teaching context (e.g., abdominal pain, OB scan, vascular study).
- Select the reasoning skill to target: observation, correlation, synthesis, or communication.
- Define criteria to distinguish 'developing' vs. 'proficient' reasoning based on depth and clarity.

56

Professional Development Integration

Building the habits and dispositions of a lifelong clinical thinker

- Technical competence is the foundation but not the endpoint: it secures entry into the profession, while professional development ensures ongoing growth and adaptability.
- Professional development encompasses communication skills, ethical reasoning, evidence-based practice, and interprofessional collaboration.
- Students should learn how to locate, evaluate, and apply current sonography literature to support evidence-based clinical decision making.

57

Professional Development Integration

Building the habits and dispositions of a lifelong clinical thinker

- Ethics and professionalism include understanding scope of practice, patient confidentiality, and maintaining a professional demeanor in complex clinical situations.
- Lifelong learning habits—such as journal clubs, conference attendance, and mentorship—support continuous improvement and adaptation to evolving sonography technologies and protocols.

58

Ethics, Professionalism & Scope of Practice

Ethical reasoning in sonography is a critical thinking process that parallels clinical reasoning, requiring sonographers to consistently 'see, interpret, decide, and act' within professional and ethical boundaries. Embedding ethics education through case discussions, role-play, and explicit instruction strengthens students' ability to navigate complex clinical and professional scenarios.
